A. Amazon S3

B. Amazon DynamoDB

C. Amazon RDS

D. ì„ë§^ì; ' í, ºë„, ºì<æìšã

Answer: C

Explanation:

Amazon RDS handles all these requirements, and although Amazon RDS is not typically thought of as optimized for key-value based access, a schema with a good primary key selection can provide this functionality. Amazon S3 provides no fixed schema and does not have consistent read after PUT support. Amazon Kinesis supports streaming data that is consistent as of a given sequence number but doesn't provide key/value access. Finally, although Amazon DynamoDB provides key/value access and consistent reads, it does not support SQL-based queries. ?The core of this question is how to send event messages to Kinesis synchronously vs. asynchronously.
