NEW QUESTION: 4
What is the function of NSF?
A. provide automatic failover to back up supervisor in VSS mode
B. forward traffic simultaneously using both supervisors
C. forward traffic based on Cisco Express Forwarding
D. provide nonstop forwarding in the event of failure of one of
the member supervisors
Answer: D
Explanation:
VSS is network system virtualization technology that pools
multiple Cisco Catalyst 6500 Series Switches into one virtual
switch, increasing operational efficiency, boosting nonstop
communications, and scaling system bandwidth capacity to 1.4
Tbps. Switches would operate as a single logical virtual switch
called a virtual switching system 1440 (VSS1440). VSS formed by

two Cisco Catalyst 6500 Series Switches with the Virtual Switching Supervisor 720-10GE. In a VSS, the data plane and switch fabric with capacity of 720 Gbps of supervisor engine in each chassis are active at the same time on both chassis, combining for an active 1400-Gbps switching capacity per VSS. Only one of the virtual switch members has the active control plane.

Both chassis are kept in sync with the inter-chassis Stateful Switchover (SSO) mechanism along with Nonstop Forwarding (NSF) to provide nonstop communication even in the event of failure of one of the member supervisor engines or chassis.
