NEW QUESTION: 1
For competitive reasons, the customers of a large shipping company called the "Integrated
International Secure Shipping Containers Corporation" (IISSCC) like to keep private the various cargos that they ship. IISSCC uses a secure database system based on the Bell-
LaPadula access control model to keep this information private.
Different information in this database is classified at different levels. For example, the time and date a ship departs is labeled Unclassified, so customers can estimate when their cargos will arrive, but the contents of all shipping containers on the ship are labeled Top Secret to keep different shippers from viewing each other's cargos.
An unscrupulous fruit shipper, the "Association of Private Fuit Exporters, Limited" (APFEL) wants to learn whether or not a competitor, the "Fruit Is Good Corporation" (FIGCO), is shipping pineapples on the ship "S.S. Cruise Pacific" (S.S. CP). APFEL can't simply read the top secret contents in the IISSCC database because of the access model. A smart APFEL worker, however, attempts to insert a false, unclassified record in the database that says that FIGCO is shipping

pineapples on the S.S. CP, reasoning that if there is already a FIGCO-pineapple-SSCP record then the insertion attempt will fail. But the attempt does not fail, so APFEL can't be sure whether or not FIGCO is shipping pineapples on the S.S. CP. What is the name of the access control model property that prevented APFEL from reading FIGCO's cargo information? What is a secure database technique that could explain why, when the insertion attempt succeeded, APFEL was still unsure whether or not FIGCO was shipping pineapples?

A. Strong *-Property and Polyinstantiation
B. Simple Security Property and Polyinstantiation
C. *-Property and Polymorphism
D. Simple Security Property and Polymorphism

Answer: B

Explanation:
The Simple Security Property states that a subject at a given clearance may not read an object at a higher classification, so unclassified APFEL could not read FIGCO's top secret cargo information.
Polyinstantiation permits a database to have two records that are identical except for their classifications (i.e., the primary key includes the classification). Thus, APFEL's new unclassified record did not collide with the real, top secret record, so APFEL was not able to learn about FIGs pineapples.
The following answers are incorrect:
*-Property and Polymorphism
The *-property states that a subject at a given clearance must not write to any object at a lower classification, which is irrelevant here because APFEL was trying to read data with a higher classification.
Polymorphism is a term that can refer to, among other things, viruses that can change their code to better hide from anti-virus programs or to objects of different types in an object- oriented program that are related by a common superclass and can, therefore, respond to a common set of methods in different ways. That's also irrelevant to this question.
Strong *-Property and Polyinstantiation
Half-right. The strong *-property limits a subject of a given clearance to writing only to objects with a matching classification. APFEL's attempt to insert an unclassified record was consistent with this property, but that has nothing to do with preventing APFEL from reading top secret information.
Simple Security Property and Polymorphism
Also half-right. See above for why Polymorphism is wrong.
