NEW QUESTION: 1
Which of the following components of configuration management involves periodic checks to determine the consistency and completeness of accounting information and to verify that all configuration management policies are being followed?
A. Configuration Auditing
B. Configuration Control
C. Configuration Identification
D. Configuration Status Accounting
Answer: A
Explanation:
Explanation/Reference:
Explanation: Configuration auditing is a component of configuration management, which involves periodic checks to establish the consistency and completeness of accounting information and to confirm that all configuration management policies are being followed. Configuration audits are broken into functional and physical configuration audits. They occur either at delivery or at the moment of effecting the change. A functional configuration audit ensures that functional and performance attributes of a configuration item are achieved, while a physical configuration audit ensures that a configuration item is installed in accordance with the requirements of its detailed design documentation. AnswerD is incorrect. The configuration status accounting procedure is the ability to record and report on the configuration baselines

associated with each configuration item at any moment of time. It supports the functional and physical attributes of software at various points in time, and performs systematic control of accounting to the identified attributes for the purpose of maintaining software integrity and traceability throughout the software development life cycle. AnswerC is incorrect. Configuration control is a procedure of the Configuration management.

Configuration control is a set of processes and approval stages required to change a configuration item's attributes and to re-baseline them. It supports the change of the functional and physical attributes of software at various points in time, and performs systematic control of changes to the identified attributes.

AnswerA is incorrect. Configuration identification is the process of identifying the attributes that define every aspect of a configuration item. A configuration item is a product (hardware and/or software) that has an end-user purpose. These attributes are recorded in configuration documentation and baselined.

Baselining an attribute forces formal configuration change control processes to be effected in the event that these attributes are changed.

Hotspot-Frage
Sie haben ein Azure-Abonnement mit dem Namen Subscroption1. In Subscription1 erstellen Sie eine Warnungsregel mit dem Namen Alert1. Die Aktionsgruppe Alert1 ist wie in der folgenden Abbildung gezeigt konfiguriert.

Das Alarmkriterium Alert1 wird jede Minute ausgelöst. Verwenden Sie die Dropdown-Menüs, um die Antwortauswahl auszuwählen, die die einzelnen Anweisungen anhand der in der Grafik angezeigten Informationen vervollständigt.
HINWEIS: Jede richtige Auswahl ist einen Punkt wert.

Answer:
Explanation:

Erläuterung:
Kasten 1: 60
Eine Warnung pro Minute löst eine E-Mail pro Minute aus.
Kasten 2: 12
Es kann nicht mehr als 1 SMS alle 5 Minuten gesendet werden, was 12 pro Stunde entspricht. Hinweis: Bei der Ratenbeschränkung handelt es sich um eine Unterbrechung von Benachrichtigungen, die auftritt, wenn zu viele an eine bestimmte Telefonnummer, E-Mail-Adresse oder ein bestimmtes Gerät gesendet werden. Die Ratenbegrenzung stellt sicher, dass Warnungen verwaltbar und umsetzbar sind.

Die Ratengrenzwerte sind:
SMS: Nicht mehr als 1 SMS alle 5 Minuten.
Stimme: Nicht mehr als 1 Sprachanruf alle 5 Minuten.
E-Mail: Nicht mehr als 100 E-Mails in einer Stunde.
Andere Aktionen unterliegen keiner
Geschwindigkeitsbeschränkung.

NEW QUESTION: 3
You plan to implement a fault tolerance solution for a
Microsoft SQL Server database. The solution must provide
failover storage on the local network.
You need to ensure that the solution can route traffic to
failover storage by using SMB 3.0.
Which storage option should you use?
A. Stretch Database
B. Microsoft Azure Blob storage
C. Always On availability group
D. Cluster Shared Volumes
Answer: D
Explanation:
Clustered Shared Volumes (CSV) is a new clustered file system
in Windows Server that is a layer of abstraction above the NTFS
file system in a WSFC environment. It allows all Nodes in the
failover cluster to read and write to the CSV volume. CSV
leverages the investments Microsoft have made in SMB 3.0, such
as SMB Direct and SMB Multichannel.
SQL Server 2014 was the first version of SQL Server to support
CSVs.
